Pavel Checkulaev

A significant part of our communication would be impossible without network technology. Endless streams of information between servers and users are provided by digital agent communication. This communication is hidden from us, as well as the work of many digital agents, continuously managing requests from users. On the monitor, you can watch for the work of digital agents on the server in real-time. If you want to hear their “voice”, you can scan a QR code and visit a web site. By this, you will initiate a communication between your device and the server.

Installation (monitor, laptop, QR-code, server in datacenter)

You can see how it works at this link: <https://www.youtube.com/watch?v=ycTbNizXR8>

**Pavel Checkulaev**

Was born in 1983.

Moscow, Russia.
